

PHOENIX SAFES ARE PROUD TO OFFER A COMPLETE RANGE OF PREFABRICATED STRONG-ROOMS. The vaults are designed to meet the exacting standards of the banking industry, pharmaceutical manufacturers and suppliers, safe deposit centres and any situation where tested and certified protection is required.

- Phoenix strong-rooms come in pre-constructed panels normally 500mm wide and prescribed length. These are welded or bolted together once on site to form a five or six sided construction. This enables the strong-room to be positioned often in confined areas, even on an upper floor or basement. Vaults can also be extended or moved as requirements change.
- The Phoenix range of vault doors are tested and certified to conform with EN 1143-1 european standards of burglary resistance. Available from grade III up to grade XI they provide the perfect partner for our demountable strong-rooms. They can also be supplied to fit into pre built or purposely constructed vault.
- The standard size allows a free opening of 1000mm wide by 2000mm high. However, bespoke sizes are available to accommodate large forklifts or wide pallets achieving heights in excess of four metres if required.
- To accompany our vault doors we supply grille gates to suit. Emergency doors are also available in smaller sizes.
- To obtain certification the vault must be a six-sided construction the exception to this is a controlled drugs installation where a five sided construction is permissible with the correct anchoring system on the floor.
- The protection is completed by a strong-room door of commensurate quality to the vault. In larger installations a second or emergency door are often prescribed.
- Phoenix offer a complete design and build service to our customers, including guidance as to the correct locks to secure your strong-room.
